                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding complement component C3. The compound specifically hybridises with the nucleic acid molecule encoding
receptor coding sequence (ADB99864), and specifically hybridizes with and inhibits the expression of vitamin D nuclear receptor. The antisense oligonucleotides are useful for treating an animal having a disease or condition associated with vitamin D nuclear receptor, e.g. cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ŋ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /not \overline{e}= "Phosphorothioate backbone and all cytosines are-methyl cytosines"

component C3 and inhibits the expression of complement component C3, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding complement component C3. Also included are a composition comprising the compound and a pharmaceutical carrier or diluent, inhibiting the expression of complement compound cited above) and treating the compound and animal comprising administering to the animal the compound cited above so that expression of complement component C3 is inhibited. The antisense compounds are useful for inhibiting the expression of complement component C3 is inhibited. The antisense compounds are useful for inhibiting the expression of complement component C3 is component C3 in cells or tissues, or for treating an animal having a disease or condition associated with complement component C3 such as an autonimmune disorder (e.g. multiple sclerosis), an infection, or atheroselerosis, inflammation, septic shock, multiple organ failure, hyperacute organ failure and CNS inflammation. The compounds are also useful as research reagents and diagnostics, in distinguishing functions of various members of a biological pathway, or for preventing or delaying infection, inflammation or tumour formation. The present sequence is an infection, inflammation or tumour formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 20 BP; 5 A; 6 C; 4 G; 5 T; 0 U; 0 Other;

Detector for identifying human papilloma virus subtypes, comprises carrier having two parts carrying first and second oligonucleotides that respectively hybridize with DNA contained in first and second subtypes of the virus.

Claim 4; SEQ ID NO 131; 221pp; English.

The invention comprises oligonucleotides for detecting and identifying subtypes of human papilloma virus (HPV) contained in a sample. The oligonucleotides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an HPV detection oligonucleotide of the invention.

A detecting apparatus and a detecting method for identifying the subtypes of many species of human papilloma viruses at the same time and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costimulatory molecules such as the B7 protein. The present sequence represents a human B7-1 targeted oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating an inflammatory skin disorder such as psoriasis comprises topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0.4%; Score 15.2; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costimulatory molecules such as the B7 protein. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating an inflammatory skin disorder such as psoriasis comprises topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.

The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotide useful for detecting single nucleotide polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gарв

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or i Y, Sandrasagra A, Ka Tang L, Shahabuddin S; WPI; 2003-229219/22 Miller S,

Disclosure; SEQ ID NO 9245; 872pp; English.

ubiquinone.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory steroid and ubiquinone. A composition of the invention communosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a seventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of deposine composition, producing bronchodilation, increasing levels of abiquinone or lung surfactant in a subject, for reducing levels of ubiquinone or lung surfactant in a subject is tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Claim 15; SEQ ID NO 1345; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intration codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an extiinflammatory steroid and ubiquinone. A composition of the invention and an autiallargic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an autinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of denosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Human oligonucleotide sequence

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing or depleting levels of, or reducing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition of the invention in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of ubiquinone or receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or natiniflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of buildinformed or confition, lung surfactant in a subject, sissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nyce JW, I
Miller S,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ubiquinone
```

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjudinone. A composition of the invention communication and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing or depleting levels of of, or reducing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject s tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

```

Human ICAM oligonucleotide sequence.

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjquinnone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubjquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention communosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antifolammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

```
for modulating the expression of interferon gamma receptor 1 (IFNGR1).

The compositions comprise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding IFNGR1. The antisense compound is useful for treating a disease or condition associated with IFNGR1, such as an autoimmune disorder (e.g. diabetes, autoimmune thyroiditis, multiple sclerosis, autoimmune arthritis, autoimmune insulinitis or Crohn's disease), cancer or a disease or condition caused by aberrant apoptosis. It is also used for inhibiting the expression of IFNGR1, as research reagents and diagnostics, to distinguish between functions of various members of a biological pathway, or tumour formation), and as probes or primers. It is also used in a antisense therapy. The present sequence is an antisense oligonucleotide targetted to human IFNGR1 DNA. This sequence is used in the exemplification of the invention

The invention relates to methods for identifying regions of neoplastic growth in a human patient, especially for detecting or predicting metastasis. The methods involve determining whether a neoplastic growth marker protein is overexpressed, either by the use of an antibody specific for the protein, or by the use of PCR or hybridisation to detect nucleic acids encoding the marker proteins. A set of neoplastic growth markers are given in ADA26759-ADA26796), with protein tyrosine phosphatase type IVA member 3 (also known as PRL-3) being a preferred neoplastic growth marker. The neoplastic growth markers are specifically expressed that the tissue has a propensity to metastasise. The invention also cancers and normal cells from which the cancer is derived. Overexpression of the neoplastic growth markers is taken as an indication that the tissue has a propensity to metastasise. The invention also encompasses methods for treating a patient with an advanced or metastatic cancers. The methods of the invention are useful for identifying regions of neoplastic growth, for detecting or predicting metastasis, or identifying candidate drugs for treating advanced or metastasis, or identifying candidate drugs for treating advanced or metastasis, or identifying cancers. The invention is particularly applicable to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence represents a PCR primer used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying regions of neoplastic growth in a human body, useful for detecting or predicting metastasis, comprises administering to the humar body an antibody or peptide that specifically binds to a protein marker of neoplastic growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gastrointestinal, prostate, breast or colorectal cancers. Antibodies which bind to the neoplastic growth marker proteins are additionally useful for diagnostic imaging and for targeting cytotoxic or

The invention relates to PCR primers (ADL16104-ADL16111) for use in the analysis of single nucleotide polymorphisms (SNPs) in the human lipoprotein lipase (LPL) gene (GenBank accession numbers AF050163) which are associated with a predisposition to obesity. The invention also encompasses a kit comprising a pair of sense and antisense primers. The primers and kit can be used to predict the likelihood of an individual developing obesity, so that it can be prevented. The present sequence represents a specifically claimed human LPL reverse PCR primer of the
                                                                                                                                                                                                                                            Human, lipoprotein lipase; LPL; polymorphism analysis;

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating by connectivity, ract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, confident depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dystunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of the invention has antiallergic, antinflammatory, antiasthmatic, instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition of sease. The administered confosition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to confosition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The composition and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary disease, pulmonary obstruction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary of transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the adjournal of the anti-sense oligos corresponding to the adjournal of the anti-sense oligos corresponding of the bardies into antial or the farget RNA serves to prevent the programe.
                      analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; 88; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

This invention describes a novel composition (a) a first active agent,

comprising oligonuclectides, effective for alleviating

bronchoconstriction, respiratory tract inflammation, allergies and

reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,

surfactant depletion or hyposecretion, when administered to a mammal. The

cligonuclectides are derived from a gene encoding or regulating

cypression of a target polypeptide associated with lung airway or lung

dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery

device, in separate containers, (b) the oligonuclectides, (c)

instructions for adding a carrier and for use of the kit. The composition

of the invention has antiallergic, antiinflammatory, antiasthmatic,

analgesic, hypotensive, immunosuppressive and cytostatic activity, is a

cheta-adrenergic agonist. The composition is useful for preventing or

treating a respiratory, lung or malignant disease. The administered

composition comprises oligo and is administered to reduce the production

or availability, or to increase the degradation of the target mRNA or to

reduce the amount of target polypeptide present in the lungs. The

pulmonary obstruction, and/or bronchoconstriction and/or lung

inflammaty obstruction, and/or bronchoconstriction and/or lung

pulmonary destruction, and/or bronchoconstriction and/or lung

pulmonary destruction, and/or bronchoconstriction and/or lung

pulmonary destruction, and/or bronchoconstriction and/or lung

pulmonary destruction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The

Inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 13813; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating

charaction or cancer and can be anti-sense to the corresponding mRNA.

The invention or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery

C device, in separate containers, (b) the oligonucleotides, (c)

instructions for adding a carrier and for use of the kit. The composition

of the invention has antiallergic, antialinflammatory, antiasthmatic,

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating comprising oligonuclectides, reflective for alleviating comprising oligonuclectides.

Treducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchocomstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies and/or surfactant hypoproduction are associated distress syndrome, pain, cystic fibrosis, allergic thinitis, pulmonary disease, pulmonary of distress syndrome, pain, cystic fibrosis, allergic and in the anti-sense oligos corresponding to the oligonclectides into the anti-sense oligos corresponding to the oligonuclectides into products that free adenosine into beart the hart reserved the present in the target RNA serves to prevent the breakdown of the oligonuclectides into products that free adenosine present in the respect the oligonuclectides into products 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             invention describes a novel composition (a) a first active agent,
                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

tΩ Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted toucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 4304; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The cligonuclectides are derived from a gene encoding or regulating dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition composition composition or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascination. inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

Katz E, Pabalan J, Aguilar D; Li Y, Sandrasagra A, K. Tang L, Shahabuddin S; Miller S, Nyce JW,

WPI; 2003-093058/08.

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 6974; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating control of bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antialfammatory, antiastered confusions. The composition is useful for preventing or beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to collect the amount of target polypeptide present in the lungs. The pulmonary obstruction, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, when a largets and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, when a manamation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, pulmonary contrasponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleoside adenosine content of the entire sense oligons corresponding to the oligonucleosides and the oligonucleosides the pulmonary beneficially and the pulmonary beneficially and the pulmonary beneficially and the pulmonary beneficially and the pulmonary e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding sterol regulatory element-binding protein-1 (SREBP-1, also known as sterol regulatory element-binding transcription factor, SREBF), and inhibits the expression of SREBP-1, i.e. is an antisense oligonucleotide. Also included are a compound 8-80 nucleobases in length that specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding sterol regulatory element-binding protein-1, a composition comprising the compound and a carrier or diluent,

```

```
inhibiting the expression of sterol regulatory element-binding protein-1
in cells or tissues (by contacting the cells or tissues with the compound
so that expression of sterol regulatory element-binding protein-1 is
inhibited) and treating an animal having a disease or condition
associated with sterol regulatory element-binding protein-1 by

cc administering to the animal a therapeutic or prophylactic amount of the
compound so that expression of sterol regulatory element-binding protein-
cc is inhibited. The antisense oligonucleotide comprises at least one
modified internucleoside linkage (preferably a phosphorothioate linkage),
at least one modified sugar moiety (preferably 2'-O-methoxyethyl sugar
cc methylcytosine). The compound, composition and methods are useful for
treating a disease or condition associated with sterol regulatory element
cc retains a disease or condition associated with sterol regulatory element
cc are also useful in research and diagnostics for modulating the expression
cc are also useful in research and diagnostics for modulating the expression
cc are also useful in research and diagnostics for modulating the expression
cc an antisense oligonucleotide targeting human SREBP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding sterol regulatory element-binding protein-1 (SREBP-1, also known as sterol regulatory element-binding transcription factor, SREBF), and inhibits the expression of SREBP-1, i.e. is an antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding sterol regulatory element-binding protein-1, useful
for treating diabetes, atherosclerosis or hyperlipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             yulatory element-binding transcription factor; SREBF;

CC Also included are a compound 8-80 nucleobases in length that specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding sterol regulatory element-binding proteinting the expression of sterol regulatory element-binding proteinting the expression of sterol regulatory element-binding proteinting so that expression of sterol regulatory element-binding proteinting associated with sterol regulatory element-binding proteinting associated with sterol regulatory element-binding proteinting compound so that expression of sterol regulatory element-binding proteinting associated with sterol regulatory element-binding proteinting associated with sterol regulatory element-binding proteinting associated internucleoside linkage (preferably a phosphorothioate linkage), at least one modified sugar moiety (preferably 5-0-methoxyethy) sugar coefficied internucleoside linkage (preferably 5-0-methoxyethy) sugar moiety) or at least one modified nucleobase (preferably 5-0-methoxyethy) as disease or condition associated with sterol regulatory element binding protein-1, such as a metabolic disorder. e.g. diabetes, or a cardiovascular disorder. e.g. atherosalerosis or hyperlipidaemia. They are also useful in research and diagnostics for modulating the expression of sterol regulatory element-binding protein-1. The present sequence is a human SREBP-1 target region for the antisense oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Seguence 20 BP; 7 A; 7 C; 3 G; 3 T; 0 U; 0 Other;

Crosby SD,

New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

Claim 4; SEQ ID NO 4377; 985pp; English.

The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The

                             delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothicate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human glucocorticoid receptor-specific antisense oligonucleotide #4661
antisense oligonucleotides of the invention are useful for preventing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to antisense compounds targeted to a nucleic acid encoding interleukin-1 (IL-1) receptor-associated kinase-1 (IRAK-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of IRAK-1. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified sugar moiety, preferably a 2'-0-1 (and field internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-1 (comprises at least one modified nucleobase, preferably a 5-10-1 (comprises at least one modified nucleobase, preferably a 5-10-1 (comprises at least one modified nucleobase, preferably a 5-10-1 (comprises at least one modified nucleotides are useful for the nethylcytosine. The antisense oligonucleotides are useful for the autoimmune disorders, altered bone metabolism, and inflammation. The present sequence represents an antisense oligonucleotide used in the present sequence represents an antisense oligonucleotide used in the
                                                                                                                                                                                     Antisense therapy; human; interleukin-1 receptor-associated kinase-1; IL-1 receptor-associated kinase-1; IRAK-1; hyperproliferative disorder e.g.; cancer; autoimmune disorder; altered bone metabolism or inflammation; cytostatic; immunosuppressive; osteopathic; antiinflammatory; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                         /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothioate
backbone and 2'-methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 5 nucleotides in length at each
end. All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compound having a sequence targeted to a nucleic acid encoding II receptor-associated kinase-1, useful for preparing a composition for treating hyperproliferative or autoimmune disorder or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.4%; Score 15.2; DB 1; Length 20;

The present invention relates to antisense compounds targeted to a nucleic acid encoding interleukin-1 (IL-1) receptor-associated kinase-1 (IRAK-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of IRAK-1. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0- It also comprises at least one modified nucleobase, preferably a 5- CC methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5- CC methylcytosine. The antisense oligonucleotides are useful for the autoimmune disorders, altered bone metabolism, and inflammation. The present sequence represents a human IRAK-1 DNA target sequence for an antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New compound having a sequence targeted to a nucleic acid encoding IL-1 receptor-associated kinase-1, useful for preparing a composition for treating hyperproliferative or autoimmune disorder or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense therapy; human; interleukin-1 receptor-associated kinase-1; IL-1 receptor-associated kinase-1; IRAK-1; hyperproliferative disorder e.g.; cancer; autoimmune disorder; altered bone metabolism or inflammation; cytostatic; immunosuppressive; osteopathic; antiinflammatory; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

                                                                                                                                                                        Homo
The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclindependent kinase 4, specifically hybridises with the nucleic acid encoding cyclin-dependent kinase 4 and inhibits expression of cyclindependent kinase 4. The antisense oligonucleotide is useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer. This sequence represents a human cyclin dependent kinase 4 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                        Phosphorothioate backbone. All cytidines
                                                                                                                                                                                                                                                                                                                                                                             "OTHER= 2'-O-Methoxyethyl (2'-MOE) nucleotides"

The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclindependent kinase 4, specifically hybridises with the nucleic acid encoding cyclin-dependent kinase 4 and inhibits expression of cyclindependent kinase 4. The antisense oligonucleotide is useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer. This sequence represents a human cyclin dependent kinase 4 antisense oligonucleotide.

The present invention describes a compound (1) of 8-80 nucleobases in length targeted to a nucleic acid molecule encoding polo-like kinase, where (1) specifically hybridises with nucleic acid molecule encoding polo-like kinase and inhibits the expression of polo-like kinase, or specifically hybridises with at least an 8-nucleobase portion of a preferred target region on a nucleic acid molecule encoding polo-like kinase. Also described: (1) a composition comprising (1) and a paramaceutical carrier or diluent; (2) inhibiting the expression of polo-like kinase in cells or tissues comprising contacting the cells or tissues comprising contacting the cells or tissues comprising contacting a preferred target region of a nucleic acid compounds comprising a preferred target region of a nucleic acid compounds comprising a preferred target region of a nucleic acid molecule encoding polo-like kinase with one or more candidate antisense compounds with one or more candidate antisense compounds with one or more candidate antisense compounds which inhibits the expression of a compounds comprising at least an 8-nucleobase portion which is complementary to the preferred target region, and selecting for one or more candidate antisense compounds which inhibits the expression of a complementary to the preferred target region, and selecting for one or more candidate antisense compounds which inhibits the expression of a compounds (1) can be used for inhibiting the complementary to the preferred target region, and subset of conficients of polo-like kinase, and can be used in artisense compounds (1) can be used for inhibiting the expression of polo-like kinase, and can be used in a sesociated with aberrant expression of polo-like kinase, and can be used to compounds with aberrant expression of polo-like kinase, inhibiting the research reagents and kits, or in diagnostic, therapeutic applications, e.g. to prophylactic applications, e.g. to prophylactic applications, e.g. to prophylactic applications, e.g. to prophylactic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compounds targeted to nucleic acid molecules encoding pololike kinase, useful for treating diseases associated with aberrant expression of polo-like kinase, e.g. non-small cell lung cancer or esophageal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polo-like kinase target oligonucleotide, which is used in an example from
                                                                                                                                                                                                                polo-like kinase; polo-like kinase inhibitor; antisense oligonucleotide; cytostatic; antiinflammatory; antimicrobial; antisense gene therapy; kinase inhibitor; hyperproliferative disorder; cancer; non-small cell lung cancer; oesophageal cancer; infection; inflammation; tumour; human; target; ss.
                                                                                                        Human polo-like kinase target oligonucleotide SEQ ID NO:114.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 15; SEQ ID NO 114; 138pp; English.

The present invention describes a compound (I) of 8-80 nucleobases in length targeted to a nucleic acid molecule encoding polo-like kinase, where (I) specifically hybridises with nucleic acid molecule encoding polo-like kinase and inhibits the expression of polo-like kinase, or specifically hybridises with at least an 8-nucleobase portion of a preferred target region on a nucleic acid molecule encoding polo-like kinase. Also described: (1) a composition comprising (I) and a composition comprising the expression of polo-like kinase in cells or tissues comprising contacting the cells or tissues with (I); (3) treating an animal having a disease or condition associated with polo-like kinase comprising administering to the animal a cherapeutic or prophylactic amount of (I) so that expression of polo-like kinase is inhibited; and (4) screening for an antisense compound comprising contacting a preferred target region of a nucleic acid molecule encoding polo-like kinase with one or more candidate antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compounds targeted to nucleic acid molecules encoding pololike kinase, useful for treating diseases associated with aberrant expression of polo-like kinase, e.g. non-small cell lung cancer or esophageal cancer.
                                                                                                                                                                                                                                       polo-like kinase; polo-like kinase inhibitor; antisense oligonucleotide; cytostatic; antiinflammatory; antimicrobial; antisense gene therapy; kinase inhibitor; hyperproliferative disorder; cancer; non-small cell lung cancer; oesophageal cancer; infection; inflammation; tumour; human; phosphorothioate; 2'-O-methoxyethyl; ss.
                                                                                                                                                                                                          Human polo-like kinase antisense oligonucleotide SEQ ID NO:55.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        'note= "phosphorothioate linkages"

compounds comprising at least an 8-nucleobase portion which is complementary to the preferred target region, and selecting for one or more candidate antisense compounds which inhibits the expression of a nucleic acid molecule encoding polo-like kinase. (I) has cytostatic, antisense gene therapy, and as a kinase inhibitor. The antisense coligonucleotides or compounds (I) can be used for inhibiting the expression of polo-like kinase, and for treating diseases or conditions associated with aberrant expression of polo-like kinase, and for treating diseases or conditions cancer or oesophageal cancer. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human polo-like kinase chimeric phosphorothioate antisense oligonucleotide, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20 BP; 0 A; 5 C; 5 G; 10 T; 0 U; 0 Other;

New antisense compound targeted to a nucleic acid molecule encoding requiem, useful for modulating expression of requiem or for treating cancer or developmental disorders.

Example 15; SEQ ID NO 50; 66pp; English.

antisense compound can also be used as research tools and diagnostics. It can also be used as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of The invention relates to a compound targeted to a nucleic acid molecule encoding requiem which specifically hybridises with the nucleic acid molecule encoding requiem and inhibits the expression of requiem. The compound, particularly the antisense oligonucleotide is useful in modulating the function of nucleic acid molecules encoding requiem. The

The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(8) chosen from e.g. cond of nucleic acid target comprising gene(8) chosen from e.g. coligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a coligonucleotide. The method is useful for preventing to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment coligonation of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the ö for treating diseases or conditions associated with requiem, preferably hyperproliferative disorder, e.g. cancer or a developmental disorder. The compound can also be used as prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents the human requiem antisense oligonucleotide. e.g., expressed within cells and tissues. The compound can also be used pulmonary hypertension; lung inflammation; bronchitis; oligonucleotide; Gaps Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes CCRI, RANTES, MCP4, useful for prophylaxis or treating respiratory .. 0 0.4%; Score 15.2; DB 1; Length 20; 85.0%; Pred. ```
The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(8) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e.g., CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory

The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding resistin, useful for treating a metabolic disorder, e.g. diabetes or obesity, or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding resistin, and inhibits the expression of resistin. The compound, composition and methods are useful for treating a disease or condition associated with resistin, such as a metabolic disease, e.g. diabetes or obesity, or atherosclerosis. They are also useful in research and diagnostics for modulating the expression of resistin. This sequence

The invention relates to a method for treating airway hyperresponsiveness or pulmonary inflammation in an individual comprising administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention also relates to a method of inhibiting expression of a nucleic acid molecule encoding B7-1 or B7-2. The antisense compound is an antisense oligonucleotide which has a modified sugar moiety and nucleobase. The human B7 protein is human B7-1 or B7-2 protein or both. The compound is useful for treating airway hyperresponsiveness or pulmonary inflammation, which is associated with asthma, by inhibiting expression of human B7 protein. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for treating airway hyperresponsiveness or pulmonary inflammation in an individual comprising administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention also relates to a method of inhibiting expression of a nucleic acid molecule encoding B7-1 or B7-2. The antisense compound is an antisense oligonucleotide which has a modified sugar moiety and nucleobase. The human B7 protein is human B7-1 or B7-2 protein or both. The compound is useful for treating airway hyperresponsiveness or pulmonary inflammation, which is associated with asthma, by inhibiting expression of human B7 protein. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense therapy; mouse; complement component C3; autoimmune disorder; multiple sclerosis; infection; atherosclerosis; neuroprotective; antiarteriosclerotic; antimicrobial; antiinflammatory; cytostatic; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                 Treating airway hyperresponsiveness or pulmonary inflammation comprises administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein to the individual.

The present invention relates to antisense compounds targeted to a nucleic acids encoding human and mouse complement component C3. The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of complement component C3 in cells. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotides further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as autoimmune disorders e.g. multiple sclerosis, infections, and atherosclerosis. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                            New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                 /mod_base= OTHER
/mod_base= This oligonucleotide has a phosphorothioate
/note= "This oligonucleotide has a phosphorothioate
backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 4 nucleotides in length. Also all
cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.
                                                                                                                                                                                                                                                                                                                                           The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                           New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure
                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimeric phosphorothioate oligonucleotide to target Navl.3 #6762.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

                                                                                                                                             The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuropathy, arthritic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.

New antisense compound targeted to a nucleic acid molecule encoding Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

Claim 4; SEQ ID NO 1240; 417pp; English.

nucleic acid molecule encoding Navi.3, where the antisense compound uncleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navi.3 expression, the oligonucleotides are designed to target present invention relates to an antisense compound targeted to a different regions of the human Nav1.3 RNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuropathy, arthritic pain, lower back pain, pain from burns, migraine headache, cluster headache, mid-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with
                                                                                                                                                                                                                                                                                                                                                 New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                 Nav1.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chimeric phosphorothioate oligonucleotide to target Nav1.3 #4162.

The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuropathy, arthritic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mid-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to an antisense compound targeted to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chimeric phosphorothioate oligonucleotide to target Nav1.3 #1129.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

```
The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with
                                                                                                                                                                                                                  New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

```
The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to ineuropathic pain, post-herpetic neuropathy, arthritic pain, lower back pain, diabetic neuropathy, trigmainal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mid-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with
                Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2.MOE wings and a deoxy gap. Used during the antisense inhibition of
human Navl.3 expression, the oligonucleotides are designed to target
different regions of the human Navl.3 RNA.

New immunostimulatory nucleic acid molecule having pyrimidine-purine dinucleotide and a chimeric backbone, useful in treating and preventing

```
The invention relates to an immunostimulatory nucleic acid molecule comprising an internal pyrimidine-purine (YZ) dinucleotide and chimeric backbone, where one internal YZ dinucleotide has a phosphodiester(-like) or stabilised internal YZ dinucleotide has a phosphodiester(-like) or stabilised internal YZ dinucleotide has a phosphodiester(-like) or stabilised. The climage, where other internucleotide linkages are stabilised. The cliponucleotide is useful in stimulatory or modulating an immune consponse. The medicament shifts the immune response to a Thl biased response. The medicament for treating asthma, allergy, cancer, in the manufacture of a medicament for treating asthma, allergy, cancer, in the manufacture of a medicament for treating asthma, allergy, cancer, in the manufacture of a medicament for treating asthma, allergy, cancer, infectious disease, autoimmune disease, airway remodeling or chronic obstructive pulmonary disease or in treating a subject who is a smoker or who is free of symptoms of asthma. The oligonucleotide is useful in unducing cytokine expression, e.g. IL-6 (interferon-alpha), IFNalpha (interferon-alpha), IFNalpha (interferon-alpha), IFNajamma) and IP-10 (interferon inducible protein). The oligonucleotide is also useful in treating and preventing infections caused by viruses, bacteria and parasites. The present sequence represents an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target cosen from a gene encoding interleukin (IL) -4 receptor, interleukin (IL) -5 receptor, CCR1, CCR3, Ectarin-1, RAWTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The oligonucleotides are useful for reducing or inhibiting expression of a configuration or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, cCR1, CCR3, Ectaxin-1, RAWTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The crespiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease (CCDP), and/or asthma and/or lung allergies associated with inflammation are not observed by pulmonary disease (CDPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary disease (CCPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary disponucleotide of the inflammation, lung inflammation, bronchitis, airway obstruction or inflammation, pronchitis, airway obstruction or inflammation, pronchitis, airway obstruction or inflammation, pronchitis, airway obstruction or inflammation, allergy and and on a place of the inflammation, and on or an oligonucleotide of the inflammation, and on or an oligonucleotide of the inflammation, allergy and one of a pronchitis, airway obstruction or an oligonucleotide of the inflammation, allergy and one of a pronchitis, airway obstruction or an oligonucleotide of 
                                                                                                                                                                                                                        Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; ss; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-5; CCR1; CCR3; Ectaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PDE4 B; PDE4 C; PDE4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; CF; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction.

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, cCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, LYPtase b, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of, adenosine and/or levels of, adenosine and receptor(s), and/or asthma and/or lung allergy, asthma, impeded respiration, allergy is the inflammation or an inflammation, allergy, asthma, impeded respiration, allergy, asthma, impeded respiration, allergy is the inflammation or an inflammation, allergy, asthma, impeded respiration, allergy is the inflammation by the contact of the contact of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 bronchoconstriction. This sequence represents an oligonucleotide of the

Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.

Claim 2; SEQ ID NO 2279; 174pp; English.

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL) 4 receptor, interleukin (IL) croptor, interleukin (IL) croptored a method of screening a candidate compound that binds to also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a reepiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, croptor mRNA encoding interleukin-4 receptor, interleukin-5 receptor, croptor mRNA encoding interleukin-4 receptor, interleukin-5 receptor, cropting or treating a respiratory or lung disease. CC (CR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are respiratory or lung disease conspiratory or lung disease. The creeptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammation, allergy, asthma, impeded respiration, cystic, fibrosis (CF), chronic obstructive pulmonary disease (CDPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or this sequence represents an oligonucleotide of the inventor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding Cytokine-inducible kinase. The compound specifically hybridises with the nucleic acid molecule encoding Cytokine-inducible kinase (which comprises a sequence of 2169 bp fully defined in the specification) and inhibits the expression of Cytokine-inducible kinase. Also described are: a method of inhibiting the expression of Cytokine-inducible kinase in cells or tissues, comprising contacting the cells or tissues with the new compound so that the expression of Cytokine-inducible kinase is inhibited; a method of screening for a modulator of Cytokine-inducible kinase, comprising contacting a preferred target segment of the nucleic acid encoding Cytokine-inducible kinase with one or more candidate modulators of Cytokine-inducible kinase, and
                                                                                                                                                                                                           cytostatic; antisense therapy; cytokine-inducible kinase; cytokine-inducible kinase inhibitor; antisense technology; cytokine-inducible kinase expression; hyperproliferative disorder; human; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotides useful for modulating Cytokine-inducible kinase expression, useful for diagnosing, preventing or treating conditions associated with aberrant kinase expression e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                /*tag~ b

identifying one or more modulators that modulate the expression of state, comprising identifying the presence of Cytokine-inducible kinase; a diagnostic method for identifying a disease state, comprising identifying the presence of Cytokine-inducible kinase in a sample using at least one of the primers or probe comprising the nucleotide sequences as mentioned in the specification; a kit or assay device comprising the above compound; and a method of treating an animal having a disease or condition associated with Cytokine-inducible kinase, comprising administering to the animal a therapeutic or prophylactic amount of the compound so that expression of Cytokine-inducible kinase is captured. The antisense oligonucleotide is useful for inhibiting the expression of Cytokine-inducible kinase expression, such as hyperproliferative disorders. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human cytokine-inducible kinase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic; antisense therapy; cytokine-inducible kinase; cytokine-inducible kinase inhibitor; antisense technology; cytokine-inducible kinase expression; hyperproliferative disorder; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /mod_base= OTHER

```
a mucleic acid molecules a compound of the molecule encoding Cytokine-inducible kinase. The compound specifically hybridises with the nucleic acid molecule encoding Cytokine-inducible kinase (which comprises a sequence of 2169 bp fully defined in the specification) and inhibitis the expression of Cytokine-inducible kinase (which compound of inhibiting the expression of Cytokine-inducible kinase in cells or tissues, comprising contacting the cells or tissues with the new compound so that the expression of Cytokine-inducible kinase is inhibited; a method of screening for a modulator of Cytokine-inducible kinase is inhibited; a method of screening for a modulator of Cytokine-inducible kinase, and comprising contacting a preferred target segment of the nucleic acid encoding Cytokine-inducible kinase with one comprising one or more modulators of Cytokine-inducible kinase, and comprising identifying the presence of Cytokine-inducible kinase in a sample using at least one of the primers or probe comprising the above compound; and a method of treating an animal comprising administering to the animal a therapeutic or prophylactic amount of the compound so that expression of Cytokine-inducible kinase is comprising administering to the animal a therapeutic or prophylactic amount of the compound so that expression of Cytokine-inducible kinase is inhibited. The antisense oligonuclectide is useful for inhibiting the rear or treat disease are present or treat disease or crodition expression of cytokine-inducible kinase is inhibited. The antisense oligonuclectide is useful for inhibiting the rear or treat disease are present or treat diseases.
                                                                                                                                                                                                                                             The invention describes a compound 8-80 nucleobases in length targeted to
  New antisense oligonucleotides useful for modulating Cytokine-inducible kinase expression, useful for diagnosing, preventing or treating conditions associated with aberrant kinase expression e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            treat diseases associated with the kinase expression, such as hyperproliferative disorders. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human cytokine-inducible kinase antisense oligonucleotide.

The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding oestrogen-responsive finger protein. The compound specifically hybridises with the nucleic acid molecule encoding oestrogen-responsive finger protein (which comprises a sequence of 24295 coestrogen-responsive finger protein. Also described are: a method of inhibiting the expression of oestrogen-responsive finger protein; a diagnostic method for identifying a disease state; a kinger protein, a diagnostic method for identifying a disease state; a kit or assay device comprising the above compound; and a method of treating an animal having a disease or condition associated with estrogen-responsive finger protein. The antisense oligonuclectide is useful for inhibiting the expression of oestrogen-responsive finger protein in cells or tissues to prevent or treat diseases associated with aberrant oestrogen-responsive finger protein expression, such as hyman oestrogen-responsive finger protein antisense or kits. This sequence represents a human oestrogen-responsive finger protein antisense or kits. This sequence represents a human oestrogen-responsive finger protein antisense ö New antisense oligonucleotides for modulating estrogen-responsive finger protein expression, useful for diagnosing, preventing or treating hyperproliferative disorders. /mod_base= OTHER /note= "OTHER= 2'-O-Methoxyethyl (2'-MOE) nucleotides" Gaps ., 0 Score 15.2; DB 1; Length 20; Pred. The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding oestrogen-responsive finger protein. The compound specifically hybridises with the nucleic acid molecule encoding oestrogen-responsive finger protein (which comprises a sequence of 24295 bp fully defined in the specification) and inhibits the expression of estrogen-responsive finger protein. Also described are: a method of inhibiting the expression of costrogen-responsive finger protein; a diagnostic method for identifying a disease state; a kit or assay device comprising the above compound; and a method of treating an animal having a disease or condition associated with estrogen responsive finger protein. The antisense oligonucleotide is useful for inhibiting the expression of oestrogen-responsive finger protein in cells or tissues to prevent or treat diseases associated with aberrant

The invention relates to a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding BAF53 (a member of the BAF complex targeted to a nucleic acid encoding BAF53 (a member of the BAF complex catin-related protein), specifically hybridises with the nucleic acid actin-related protein), specifically hybridises with the nucleic acid encoding BAF53 comprising 28001-bp sequence (derived from human chromosome 3) and inhibits expression of BAF53, i.e. an antisense chromosome 3) and inhibits expression of BAF53, i.e. an antisense compound and treating are inhibiting the expression of BAF53 in cells or tissues, screening for a modulator of BAF53, a diagnostic method compound and treating an animal having a disease or condition associated with BAF53. The oligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorder), e.g. cancer or a tumour. The present sequence is an antisense oligonucleotide targeting human BAF53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding BAF53 (a member of the BAF complex (BRG1/brm-associated factor), BRG1-associated factor 53kDa which is an actin-related protein), specifically hybridises with the nucleic acid encoding BAF53 comprising 28001-bp sequence (derived from human chromosome 3) and inhibits expression of BAF53, i.e. an antisense oligonucleotide. Also included are inhibiting the expression of BAF53 in cells or tissues, screening for a modulator of BAF53, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with BAF53. The oligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer or a tumour. The BAF53 gene is located on chromosome 3. The present sequence is a BAF53 genomic DNA target sequence for an antisense oligonucleotides.
                                                                                                                                   Human; ds; antisense; chromatin; BAF complex; BRG1/brm-associated factor; BAF53; BRG1-associated factor 53kDa; cancer; tumour; actin-related protein; hyperproliferative disorder; chromosome 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide compound that inhibits expression of BAF53, useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer.
                                                                                              Human BAF53 antisense oligonucleotide target region #10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20 BP; 9 A; 2 C; 7 G; 2 T; 0 U; 0 Other;

The invention relates to a novel method for treatment of a patient suffering from a condition mediated by release of proinflammatory cytokine e.g. appendictis involving treating a patient with a cholinergic agonist (al) selective for an alpha-7 nicotinic receptor to decrease the amount of the proinflammatory cytokine which is released from a macrophage. A cholinergic agonist has antiinflammatory.

CC decrease the amount of the proinflammatory cytokine which is released from a macrophage. A cholinergic agonist has antiinflammatory.

CC decrease the amount of the proinflammatory cytokine which is released contigued; antibacterial, immunosupterssive, vasotropic, vulnerary, antipallergic, antimalarial, antianginal, cardiant, antiarteriosclerotic, fungicide, antimalarial, antianginal, cardiant, antiarteriosclerotic, antiarthritic, ophthalmological, cytostatic, osteopathic, antigout, antiarthritic, ophthalmological, cytostatic, osteopathic, antigout, antidiabetic, and antipsoriatic activity. A compound of the invention is useful for the treatment of tassase involving the gases and associated tissues, diseases involving the urogenical system and associated tissues, systemic or local inflammatory diseases and conditions of the skin, diseases involving the central or peripheral conditions of the skin, diseases involving the central or peripheral conditions of the skin, diseases involving the central or peripheral conditions system and associated tissues, alseases involving the central or peripheral concerous system and associated tissues, alseases involving the central or peripheral concerous system and associated tissues, alseases involving the central or peripheral concerous system and associated tissues, autoimmune and inflammatory disorders, and muscles and connective tissues, autoimmune and inflammatory disorders and muscles are expressed and use to a proper and associated tissues, autoimmune and inflammatory disorders and muscles and connective tissues, alseases involving the represent of sequence represents an es subunit of a nicotinic receptor.

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding acyl-coenzyme A synthetase 1 (ACS1). The antisense compound specifically hybridises with and inhibits the expression of ACS1. The antisense oligonucleotides or compounds are useful for inhibiting the expression of acyl-coenzyme A synthetase 1 (ACS1), and for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes, obesity, metabolic syndrome X, cardiovascular disorder or cancer. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents an acyl-coenzyme A synthetase 1, ACS1, antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compounds targeted to nucleic acid molecules encoding acyl-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              coenzyme A synthetase 1 (ACS1), useful for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to the identification of a novel susceptibility locus AST-1 for asthma and other IgE mediated diseases mapped to the human chromosome 7p14-p15. Specifically, it refers to two overlapping genes namely GPRA (G-protein coupled receptor for asthma susceptibility) and AAA1 (asthma associated alternatively spliced gene 1). The present invention describes identifying single nucleotide polymorphisms, as well as insertion or deletion polymorphisms, occurring at different positions in the AST-1 locus, and furthermore providing vectors, host cells, primers and probes in order to determine the status of an individual. Accordingly, it provides a kit to diagnose or assess predisposition to asthma, chronic obstructive pulmonary disease or cancer and other IgE mediated diseases including rhinitis and dermatitis, such that derived pharmaceutical compositions exhibit cytostatic and antiasthmatic activities. Furthermore, it provides a transgenic animal comprising the asthma locus-1 (AST-1) DNA. This oligonucleotide sequence is a 5, splice including this asthma locus-1 (AST-1) DNA. This oligonucleotide sequence is a 5, splice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               asthma locus-1 (AST-1) DNA. This oligonucleotide sequence is a 5' splice junction of the human AAA1 gene, given in Table 11 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New GPRA polypeptides, useful in preparing a composition for diagnosing, treating or preventing asthma, other IgE-mediated disease, chronic obstructive pulmonary disease or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vendelin J;

                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                         This invention relates to a novel gene that encodes a protein exhibiting 20 alpha-hydration steroid dehydrogenase (20-HSD) activity, an enzyme involved in progesterone metabolism. Specifically, it refers to a mouse animal model that lacks the gene encoding this enzyme, and hence provides a model that can be used for the study of miscarriage resulting from the progesterone dysbolism of a parent or offspring. The present invention describes progesterone dysbolism as a cause of miscarriage in meal resource animals in the livestock farming industry, such that it provides a route to investigate a treatment method and/ or an early check up method with respect to reproductive disturbances occurring in these animals. This oligonucleotide sequence is a PCR primer given in an
                                                                                                                                                                                                   New gene encoding a protein exhibiting 20(alpha)-hydration steroid dehydrogenation enzyme activity, useful for metabolizing progesterone to inactive 20(alpha)-dihydroprogesterone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

This invention relates to a novel gene that encodes a protein exhibiting 20 alpha-hydration steroid dehydrogenase (20-HSD) activity, an enzyme involved in progesterone metabolism. Specifically, it refers to a mouse animal model that lacks the gene encoding this enzyme, and hence provides a model that can be used for the study of miscarriage resulting from the progesterone dysbolism of a parent or offspring. The present invention describes progesterone dysbolism as a cause of miscarriage in meal resource animals in the livestock farming industry, such that it provides a route to investigate a treatment method and/ or an early check up method with respect to reproductive disturbances occurring in these animals. This oligonucleotide sequence is a PCR primer given in an exemplification of the invention.
New gene encoding a protein exhibiting 20(alpha)-hydration steroid dehydrogenation enzyme activity, useful for metabolizing progesterone to inactive 20(alpha)-dihydroprogesterone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tyrosine kinase; cancer; anti-cancer agent; signalling molecule; tumourigenesis; somatic alteration; colorectal cancer; NTRK3; FES; GUCY2F; MCCK; MLK4; kinase domain; cytostatic; tyrosine kinase inhibitor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Activated mutant protein tyrosine kinases (e.g. NTRK3, FES and MCCK) and associated methods for diagnosing cancer and screening for anti-cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel activated mutant protein tyrosine kinases and associated methods for diagnosing cancer and screening for anti-cancer agents. Protein kinases are signalling molecules involved in tumourigenesis. Mutational analysis of the human tyrosine kinase gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel mutant protein tyrosine kinase-related oligonucleotide SeqID659

family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NTRK3, FES, GUCY2F and MCCK/MLK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity acting as protein tyrosine kinase inhibitors or guanylate cyclase stimulators. The invention may be useful for developing methods for detecting mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a human-derived oligonucleotide which is related to the invention.

Activated mutant protein tyrosine kinases (e.g. NTRK3, FES and MCCK) as associated methods for diagnosing cancer and screening for anti-cancer WPI; 2004-718702/70.

Disclosure; SEQ ID NO 1052; 363pp; English.

This invention relates to a novel activated mutant protein tyrosine kinases and associated methods for diagnosing cancer and screening for anti-cancer agents. Protein kinases are signalling molecules involved in tumourigenesis. Mutational analysis of the human tyrosine kinase gene family identified somatic alteration sin 1 in 5 colorectal cancers, with the majority of mutations occurring in the NTRK3, FBS, GUCY2F and MCCK/MLK4 genes. Most were identified in the kinase domain. The invention may be useful for the production of compounds with a cytostatic activity acting as protein tyrosine kinase inhibitors or guanylate cyclase stimulators. The invention may be useful for developing methods for detecting mutations involved in cancer or screening for anti-cancer agents. The present sequence is that of a human-derived oligonucleotide which is related to the invention.

Treating type II diabetes involving hepatic nuclear factor 4 - useful, e.g. to treat insufficient HNF expression or bioactivity, overexpression of HNF or expression of mutant HNF gene in diabetic patients.

Disclosure; Page 86; 116pp; English.

This is the nucleotide sequence of the PCR primer used for amplification in the method of invention, involving the treatment of type II diabetes with hepatic nuclear factor 4 (HNP-4). The agonists of normal HNF bloactivity can be used to treat diabetes, e.g. to ameliorate disease symptoms involving insufficient expression of an HNF gene and/or cinadequate functional HNF bloactivity in a subject. The antagonists of a disease-causing HNF bloactivity can be used to treat diabetes, e.g. to ameliorate disease symptoms involving expression of a mutant HNF gene or overexpression of a normal HNF gene. It is also useful to ameliorate disease symptoms involving a mutant (non-functional) HNF protein e.g. by administering a therapeutically effective amount of an anti-HNF antibody. Protein that binds to the mutant HNF-4 protein and antibody assays, e.g. to identify antagonists/agonists of an interaction between a HNF protein and a binding protein to develop drugs for disease treatment. Diabetes mellitus is a common metabolic disorder, and most cases are type component is implicated, but few genes have been identified. Mature onset forms, but genes for MODY) loci have been linked to rare early-onset forms, but genes for MODY1 and MODY3 have not been identified. HNF-4 is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the nucleotide sequence of the PCR primer used for amplification in the method of the invention, which involves modulating the expression of hepatic nuclear factor or other diabetes related gene. The method is used to treat early onset type II diabetes and defects in insulin secretion. It is based on the discovery that certain mutations in the HNFI gene, encoding a transcription factor, are involved in these conditions

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inozyme; G-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease;

The invention is related to a nucleic acid molecule which down required acids may be enzymatic nucleic acids molecule which down required acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NCM motif) promain a map of the collar and proper (cleaving RNA with a NCM motif). The CD20-targetting nucleic acid is used to cleave RNA with a YCM motif). The CD20-targetting nucleic acid is used to cleave RNA cof CD20 in the presence of a divalent cation that is preferably Mg^2+.

The real and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (MLD), bulky low-grade or follicular NHL, lymphocytic lymphoma, leukaemia, HTV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, createsting nucleic acid is used to clearably Mg^2+. Furthermore, the presence of a divalent cation that is preferably Mg^2+. Furthermore, the creatected with a cell to reduce NOGO activity of the concacted with a collicular sociated with the level of NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of cone or more cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of cone or more central nervous system (CNS) injury and cerebrovascular accident (CNS), stroke), Alzheimer's disease, dementia, multiple scleaci ataxia, Huntington of s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGO2). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NRY motif) properties an amberzyme (cleaving RNA with an NRY motif) a an amberzyme (cleaving RNA with an NRY motif) a zinzyme (cleaving RNA with a NRY motif) in the presence of a divalent cation that is preferably MG<sup>2</sup> +.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more the cation (MCL), immunocytoma (IML), bulky low-grade or follicular NHL, lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, cleave RNA) in the MOGO et argetting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the creatment may further comprise the use of one or more cated may be contacted with a cell to reduce NOGO gene in the cargetting nucleic acid may be contacted with a cell to reduce NOGO acid and bevel of NOGO. The treatment may further comprise the use of one or more cated nat reat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more contact central nervous system (GNS) injury and creaberovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropsthy, amycrophic lateral sclerosis (MS), parkinson's disease, ataxia, Huntington's disease, central enterted neurodegenerative disease ataxia, Huntington's disease, central enterted neurodegenerative disease.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 30; Page 142; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGCO). The nucleic acids (e.g. a ribozyme or a numberzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule or gossessing an NCH motif), a G-cleaver (cleaving RNA with a NGN triplet), a zinzyme (cleaving RNA with a NGN triplet) a zinzyme (cleaving RNA with a NGN triplet) a zinzyme (cleaving RNA with a recomplete acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+.

CC FUZTO THE treatment may further comprise the use of one or more treatment may further comprise the use of one or more correct lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-treat lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic lymphoma, luckaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (MC), small B-cell lymphocytic lymphoma, immunocytoma (MC), small B-cell lymphocytic lymphoma, correcting nucleic acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably Mg^2+. Furthermore, the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more

therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents an example of an antisense oligonucleotide of the invention. The oligonucleotides are 8-50 nucleotides in length, and are targeted to a nucleic acid encoding human B-raf and which is capable of inhibiting human B-raf expression. The oligonucleotides is used to inhibit the (abnormal) expression of human B-raf, to inhibit hyperproliferation of cells, to treat or prevent an abnormal proliferation of cells, to treat or prevent an abnormal as cancer (e.g. of the brain or nervous system), restenosis, psoriasis or a disorder characterised by T-cell activation and growth. They may also be used to diagnose these diseases, as well as atherosclerosis. The oligonucleotides of the invention may be used to distinguish raf-associated tumours from tumours having other etiologies. The antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense oligonucleotide; B-raf; human; inhibitor; T-cell activation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
The invention comprises antisense oligonucleotides which are targeted to the coding region of the human helicase-moi gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of human helicase-moi in cells or tissues, and for treating a helicase-moi-associated condition. The antisense oligonucleotides of the invention may also be used to delay infection, inflammation and tumour formation. The present DNA sequence represents a human helicase-moi gene antisense oligonucleotide of the invention. NOTE: The present DNA sequence has a phosphorothicate backbone, bases 1-5 and 16-20 are 2'-methoxyethyl (2'-MOE) nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound for modulating expression of human helicase-moi
oligonucleotides can also be used to quantify raf expression in assays
                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and for treating inflammation, specifically hybridizes to a specific region in nucleic acid molecule encoding the human helicase-moi.
                                                                                                                                                                                                                                                                                                                                                                                              Human, antisense gene therapy, phosphorothioate backbone, antisense oligonucleotide, helicase-moi gene, inflammation; ss; helicase-moi-associated condition; infection; tumour formation, 2-MOE nucleotide, 2'-methoxyethyl nucleotide.

The invention describes a method of preventing or treating tumour metastasis in an animal comprising administering to the animal an oligonucleotide 8-50 nucleotides in length, which is targeted to mRNA encoding human raf and capable of inhibiting raf expression. Also disclosed are raf oligonucleotides, nucleic acids, proteins and compositions used in the methods of the invention. The oligonucleotides have cytostatic and antiarteriosclerotic properties, are useful as Rafinhibitors and in antisense-therapy. The methods and compositions of the present invention are useful for preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumours. This sequence represents a human b-raf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumors, using antisense oligonucleotide modulation of human raf gene expression.
                                                                                                          tumour metastasis; human; raf; raf expression inhibitor; cytostatic; antiarteriosclerotic; antisense-therapy; hyperproliferative disorder; atherosclerosis; tumour; b-raf kinase; antisense oligonucleotide; ss.

          8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       are targetted to nucleic acids encoding human raf proteins and capable of inhibiting raf expression. The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an antisense oligonucleotide targetted to human B-raf kinase
                                                                                                                                                                                                                                   Human; raf; hyperproliferation; neovascularisation; ocular angiogenesis; therapy; cancer; cytostatic; anti-angiogenic; vascular; ophthalmological; antisense; phosphorothioate backbone; B-raf kinase; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present invention relates to novel antisense oligonucleotides which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating cancer, angiogenesis or neovascularization by administering antisense oligonucleotides targeted to human raf sequences.
                                                                                                                                                                                   Human B-raf kinase antisense oligonucleotide ISIS #14141.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0.4%; Score 15; DB 1; Length 20; 100.0%; Pred. The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisflammatory steroid in a subject, for reducing levels of of or reducing sensitivity to adenosine, reducing levels of ung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjudinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubjquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         *******
                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligonucleotide 8-50 nucleotides in length

which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a

protein kinase playing a regulatory role in signal transduction,

regulating cell proliferation and has been implicated in lung carcinoma),

and which is capable of inhibiting raf expression. Also included is a

composition comprising the oligonucleotide and a pharmaceutically

acceptable carrier. The antisense oligonucleotide is useful for

inhibiting the expression of human raf in human cells or tissues, by

contacting the human cells or tissues with the oligo. The oligo. is also

contacting the expression of raf by administering it in combination with a

contacting the expression of raf by administering it in combination with a

contacting the condition such as cancer, angiogenesis or

consequence of raf is abnormal expression, and the condition is a

hyperproliferative condition such as cancer, angiogenesis or

neovascularisation). The oligo. is also useful for inhibiting

hyperproliferation of cells. The oligos are also useful as tools, for

example for detecting and determining the role of raf expression in

warious cell functions and physiclogical processes and conditions and for

diagnosism conditions and physiclogical processes and conditions and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                     Novel antisense oligonucleotide which is targeted to mRNA encoding human raf and which is capable of inhibiting raf expression, useful for treating or preventing hyperproliferative conditions such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            conditions associated with raf expression and for research The present sequence is an antisense oligonucleotide targeting
antisense gene therapy, chemotherapeutic agent; angiogenesis; hyperproliferative condition; neovascularisation; ocular angiogenesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to antisense oligonucleotides, compositions and methods for modulating the expression of helicase-moi. The oligonucleotides are used in treating an animal having a disease or condition associated with helicase-moi, such as inflammation, a hyperproliferative disorder or a condition that arises from RNA-mediated interference. The present sequence represents a human helicase-moi antisense oligonucleotide.
                                                                                                                                                                                                /mod_base= Other

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 1602; 763pp; English.

%XCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCX

composition comprises, and composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pull monary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory disease, pulmonary construction, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. Transplantation rejection, pulmonary infections, bronchitis or cancer. Transplantation rejection, pulmonary infections, bronchitis or cancer. Thy erduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, This invention describes a novel composition (a) a first active agent,

t O oligonucleotide containing less percentage of adenosine, targeted toncleic acids associated with lung airway or lung dysfunction, and Comprising oligonucleotides, effective for alleviating adentication, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) containers, (b) the oligonucleotides, (c) containers, (b) the oligonucleotides, (c) containers, administered of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or creating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, and inflammation, allergies, asthma, impeded respiratory content of the anti-sense syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary infections, bypertension, emphysema, chronic obstructive pulmonary disease, pulmonary content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into preducts that free adenosine into preducts that free adenosine into preduc

The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human DEXRAS1 polypeptide which specifically hybridises with the nucleic acid molecule and inhibits the expression of DEXRAS1. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense oligonucleotides and compounds are useful for inhibiting the expression of DEXRAS1, e.g. hyperproliferative disorders such as cancer, neurological disorders or a disease or condition arising from aberrant nitric oxide signalling. The antisense compounds are also useful as research reagents and kits or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. This sequence represents an antisense oligonucleotide target region of the invention.
                                                                                                                                                                                                                                ö

The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human DEXRAS1 polypeptide which specifically hybridises with the nucleic acid molecule and inhibits the expression of DEXRAS1. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense oligonucleotides and compounds are useful for inhibiting the expression of DEXRAS1 and for treating diseases or conditions associated with expression of DEXRAS1, e.g. hyperproliferative disorders such as cancer, neurological disorders or a disease or condition arising from aberrant nitric oxide signalling. The antisense compounds are also useful as research reagents and kits or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. This sequence represents an antisense oligonucleotide of the invention.
